Subject: Re: Deer Park, Texas

Addressing per- and polyfluoroalkyl substances (PFAS) is one of the U.S. Environmental Protection Agency's (EPA's) top priorities and the Agency is actively working through the Unified Command to address any PFAS concerns associated with the use of Aqueous Film Forming Foam (AFFF) in response to the fire at the Intercontinental Terminals Company (ITC) Deer Park facility near Houston, Texas. AFFF is an ineffective tool in fighting fires, though certain varieties of AFFF may contain PFAS chemicals. PFAS is a group of man-made chemicals that have been widely used in everyday products since the 1940s and as such can be found in the environment. There is evidence that exposure to PFAS can lead to adverse human health effects.

As part of EPA's response efforts, the Agency is taking the following steps to address PFAS:

- First, EPA is working with ITC and first responders through the Unified Command to collect information about the different types of foams that were used to fight the fire. This information will help the Agency further refine its efforts to sample for and address any PFAS contamination in the area.
- Second, on March 21, 2019, the day after the fire was initially extinguished, EPA began monitoring surface water for PFAS (including PFOA and PFOS) in both Tucker Bayou and Buffalo Bayou. The Agency expects to receive and make public the first round of sampling results in the coming days.
- Third, through an Administrator Order issued on March 23, 2019, EPA has required ITC to conduct surface water sampling for contaminants, including PFAS. The order also requires ITC to remove spilled material and take actions to prevent it from migrating farther downstream.
- Fourth, EPA is working to develop and implement a robust surface water sampling plan that could include sampling for additional PFAS chemicals. EPA will rely on all available tools and methods to provide as much information to the public as possible about PFAS levels in local waterways.

Texas Commission on Environmental Quality (TCEQ) has reported that sources of water used to provide drinking water by the local water utility are not impacted by the incident. TCEQ has also provided information for Deer Park residents who use wells north of Texas 225 on testing their water.

EPA will continue to engage with the Unified Command throughout the response on any PFAS-related issues.

Please keep me informed on your progress in retaining the foam used to stop fire & the water protection procedures. Thx, Ron
